All Alfalfa Forage: Area Harvested, Yield (Dry Equivalent) and Production, 2000 ^{5/ 6/}

2000	55	3.36	185
------	----	------	-----

^{1/} Forage production includes all forms of harvested hay on a dry equivalent basis. Several assumptions are made to convert haylage and greenchop to a dry equivalent. Haylage production is based on haylage weight at harvest and then converted to dry equivalent production. Factors used were: one ton of dry, baled hay = 0.87 ton dry matter; one ton of haylage = 0.45 ton dry matter; one ton of greenchop = 0.25 ton dry matter; greenchop = 10% of haylage production. ^{2/} Estimates began in 2000. ^{3/} Figures for this table include only Alfalfa and Alfalfa mixtures that were harvested as haylage or greenchop. Alfalfa harvested as dry hay is not included. For an estimate of per acre yields of alfalfa in all forms (wet and dry), see the table for Alfalfa hay. ^{4/} All Forage is the sum of the following dry equivalents: a) alfalfa hay harvested as dry hay, b) all other hay harvested as dry hay, c) alfalfa haylage and greenchop, d) all other hay haylage and greenchop. ^{5/} All alfalfa hay includes all alfalfa acreage and production as a dry equivalent basis. The same assumptions are made to convert haylage and greenchop to a dry equivalent for all alfalfa hay. ^{6/} All alfalfa production is the sum of alfalfa hay harvested as dry hay and haylage and greenchop production (dry equivalent).
